

# Module N: Numerical

**How can we use numerical approximation methods to apply and solve unsolvable ODEs?**

At the end of this module, students will be able to...

- N1. First Order Existence and Uniqueness.** ...determine when a unique solution exists for a first order ODE
- N2. Second Order Linear Existence and Uniqueness.** ...determine when a unique solution exists for a second order linear ODE
- N3. Systems Existence and Uniqueness.** ...determine when a unique solution exists for a system of first order ODEs
- N4. Euler's method for first order ODEs.** ...use Euler's method to find approximate solution to first order ODEs
- N5. Euler's method for systems.** ...use Euler's method to find approximate solutions to systems of first order ODEs

## Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- State the definition of a spanning set, and determine if a set of Euclidean vectors spans  $\mathbb{R}^n$  **V4**.
- State the definition of linear independence, and determine if a set of Euclidean vectors is linearly dependent or independent **S1**.
- State the definition of a basis, and determine if a set of Euclidean vectors is a basis **S2,S3**.
- Find a basis of the solution space to a homogeneous system of linear equations **S6**.

# Module N Section 1

### Definition N.1.1

A **linear transformation** (also known as a **linear map**) is a map between vector spaces that preserves the vector space operations. More precisely, if  $V$  and  $W$  are vector spaces, a map  $T : V \rightarrow W$  is called a linear transformation if

- ①  $T(\mathbf{v} + \mathbf{w}) = T(\mathbf{v}) + T(\mathbf{w})$  for any  $\mathbf{v}, \mathbf{w} \in V$ .
- ②  $T(c\mathbf{v}) = cT(\mathbf{v})$  for any  $c \in \mathbb{R}, \mathbf{v} \in V$ .

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.
