

## Module D: Discontinuous functions in ODEs

**How can we solve and apply ODEs involving functions that are not continuous?**

At the end of this module, students will be able to...

- D1. Laplace Transform.** ...compute the Laplace transform of a function
- D2. Discontinuous ODEs.** ...solve initial value problems for ODEs with discontinuous coefficients
- D3. Modeling non-smooth motion.** ...model the motion of an object undergoing discontinuous acceleration
- D4. Modeling non-smooth oscillators.** ...model mechanical oscillators undergoing discontinuous acceleration

## Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- State the definition of a spanning set, and determine if a set of Euclidean vectors spans  $\mathbb{R}^n$  **V4**.
- State the definition of linear independence, and determine if a set of Euclidean vectors is linearly dependent or independent **S1**.
- State the definition of a basis, and determine if a set of Euclidean vectors is a basis **S2,S3**.
- Find a basis of the solution space to a homogeneous system of linear equations **S6**.

# Module D Section 1

### Definition D.1.1

A **linear transformation** (also known as a **linear map**) is a map between vector spaces that preserves the vector space operations. More precisely, if  $V$  and  $W$  are vector spaces, a map  $T : V \rightarrow W$  is called a linear transformation if

- ①  $T(\mathbf{v} + \mathbf{w}) = T(\mathbf{v}) + T(\mathbf{w})$  for any  $\mathbf{v}, \mathbf{w} \in V$ .
- ②  $T(c\mathbf{v}) = cT(\mathbf{v})$  for any  $c \in \mathbb{R}, \mathbf{v} \in V$ .

In other words, a map is linear when vector space operations can be applied before or after the transformation without affecting the result.
