## Readiness Assurance Outcomes

Before beginning this module, each student should be able to...

- Determine the intervals on which a polynomial is positive, negative, or zero.
- Use integration techniques like substitution, integration by parts, and partial fraction decomposition to compute indefinite integrals.
- Determine when a vector field is conservative.
- Find the potential function of a conservative vector field.
- Use variation of parameters to solve non-homogeneous first order constant coefficient ODEs (Standard C1)

## Definition F.1.1

A **first order ODE** is an equation involving (for a function  $y(x)$ ) only  $y'$ ,  $y$ , and  $x$ .

We will most often deal with **explicit first order ODEs**, which can be written in the form

$$y' = f(y, x)$$

for some function  $f(y, x)$ .

**Activity F.1.2** (*~5 min*)

Consider the (explicit) first order ODE

$$y' = y^2 - x^2$$

.

**Activity F.1.2** (*~5 min*)

Consider the (explicit) first order ODE

$$y' = y^2 - x^2$$

.

*Part 1:* Compute  $y'$  at each of the points  $(1, 1)$ ,  $(2, 1)$ ,  $(3, -2)$ , and  $(4, -7)$ .

**Activity F.1.2** (*~5 min*)

Consider the (explicit) first order ODE

$$y' = y^2 - x^2$$

.

*Part 1:* Compute  $y'$  at each of the points  $(1, 1)$ ,  $(2, 1)$ ,  $(3, -2)$ , and  $(4, -7)$ .

*Part 2:*

Let  $y_0(x)$  be a solution that passes through the point  $(1, 1)$ . What can you conclude about  $\lim_{x \rightarrow \infty} y_0(x)$  ?

- (A)  $\lim_{x \rightarrow \infty} y_0(x) = -\infty$
- (B)  $\lim_{x \rightarrow \infty} y_0(x)$  is a finite number
- (C)  $\lim_{x \rightarrow \infty} y_0(x) = \infty$

**Definition F.1.3**

These kinds of questions are easier to answer if we draw a **slope field** (sometimes called a **direction field**).

To draw one, draw a small line segment or arrow with the correct slope at each point.

$$y' = y^2 - x^2$$

**Activity F.1.4** ( $\sim 5$  min)

**Observation F.1.7**

How can we solve  $y' = xy - x$  exactly?

Notice  $xy - x = x(y - 1)$ , so we can write  $y' = x(y - 1)$ .

Write

$$\frac{y'}{y - 1} = x.$$

This is called a **separable** DE.

**Observation F.1.8**

Integrate both sides (and switch to Leibniz notation):

$$\int \frac{1}{y-1} \frac{dy}{dx} dx = \int x dx.$$

The substitution rule (i.e. chain rule) says this is equivalent to

$$\int \frac{1}{y-1} dy = \int x dx.$$

Thus,  $\ln |y-1| = \frac{1}{2}x^2 + c$ . Exponentiating, we have

$$|y-1| = e^{\frac{1}{2}x^2+c} = e^{\frac{1}{2}x^2} e^c = c_0 e^{\frac{1}{2}x^2}.$$

Allowing  $c_0$  to take on negative values, we can drop the absolute value sign, and obtain

$$y = 1 + c_0 e^{\frac{1}{2}x^2}.$$

Section F.5

Section F.6

Section F.7

## Module F Section 3

## Observation F.3.1

There are two very simple kinds of separable ODEs.

Equations of the form  $y' = f(x)$  can be solved immediately by integrating and produce explicit solutions.

Equations of the form  $y' = f(y)$  are often impossible or difficult to solve explicitly. They are called **autonomous** equations.

**Activity F.3.2** (*~10 min*)

Consider the autonomous equation

$$y' = y^2.$$

*Part 6:* Describe the long term behavior of solutions passing near the point  $y(11) = 2$ .

### Definition F.4.3

The **critical points** of an autonomous DE are the numbers that give rise to equilibrium solutions (e.g.  $0, -1, 2$  in the previous problem).

A **source** is an unstable equilibrium in which all nearby trajectories move away in the limit.

A **sink** is a stable equilibrium in which all nearby trajectories approach the equilibrium in the limit.

There are also unstable equilibria in which some nearby trajectories return, while others diverge, analogous to a saddle point.

## Observation F.5.1

In module C, we solved **constant coefficient linear ODEs**.

Today we will observe that our existing techniques allow us to solve all **first order linear ODEs**, i.e. ODEs of the form

$$a(x)y' + b(x)y + c(x) = 0.$$

Such equations can always be rewritten (by rearranging and dividing by  $a(x)$ ) in **standard form**:

$$y' + P(x)y = Q(x).$$

**Observation F.6.1**

A vector field  $\langle P, Q \rangle$  corresponds to the slope field of the differential equation

$$\frac{dy}{dx} = \frac{Q}{P}.$$

Thus, a solution to this ODE describes the path taken by the particle in this fluid flow.

**Activity F.6.2** (*~10 min*)

Consider the ODE

$$\frac{dy}{dx} = \frac{-2xy^2 - 1}{2x^2y}.$$

This can be rewritten as

$$(2xy^2 + 1) + 2x^2y \frac{dy}{dx} = 0.$$

Now, consider  $\phi(x, y) = x^2y^2 + x$ .

**Activity F.6.2** (*~10 min*)

Consider the ODE

$$\frac{dy}{dx} = \frac{-2xy^2 - 1}{2x^2y}.$$

This can be rewritten as

$$(2xy^2 + 1) + 2x^2y \frac{dy}{dx} = 0.$$

Now, consider  $\phi(x, y) = x^2y^2 + x$ .

*Part 1:* Compute  $\nabla\phi$ .

**Activity F.6.2** (*~10 min*)

Consider the ODE

$$\frac{dy}{dx} = \frac{-2xy^2 - 1}{2x^2y}.$$

This can be rewritten as

$$(2xy^2 + 1) + 2x^2y \frac{dy}{dx} = 0.$$

Now, consider  $\phi(x, y) = x^2y^2 + x$ .

*Part 1:* Compute  $\nabla\phi$ .

*Part 2:* Differentiate the equation  $\phi(x, y) = c$  with respect to  $x$ .

**Activity F.6.2** (*~10 min*)

Consider the ODE

$$\frac{dy}{dx} = \frac{-2xy^2 - 1}{2x^2y}.$$

This can be rewritten as

$$(2xy^2 + 1) + 2x^2y \frac{dy}{dx} = 0.$$

Now, consider  $\phi(x, y) = x^2y^2 + x$ .

*Part 1:* Compute  $\nabla\phi$ .

*Part 2:* Differentiate the equation  $\phi(x, y) = c$  with respect to  $x$ .

*Part 3:* Solve the ODE  $(2xy^2 + 1) + 2x^2y \frac{dy}{dx} = 0$ .

**Definition F.6.3**

If  $\langle M, N \rangle$  is a conservative vector field, the ODE

$$M + N \frac{dy}{dx} = 0$$

is called **exact**. This ODE can also be written

$$\frac{dy}{dx} = \frac{-M}{N}.$$

If  $\phi(x, y)$  is a potential function of  $\langle M, N \rangle$ , the general solution to the ODE is  $\phi(x, y) = c$ .

**Careful:** The slope field of the ODE  $\frac{dy}{dx} = \frac{-M}{N}$  is the vector field  $\langle -N, M \rangle$  !

**Activity F.7.3** (*~20 min*)

Find solutions for the ODE

$$1 + \frac{x}{x^2 + y^2} + \left( \frac{y}{x^2 + y^2} \right) \frac{dy}{dx} = 0$$

for each of the following initial conditions

(a)  $y(0) = -1.$

(b)  $y(-2) = -2.$

(c)  $y(-4) = -4.$

Plot each of the solution curves.
